

Simple Paging (Real Paging)

①

- Mapping: Page \rightarrow Frame
PT (page table)

- Page and frame both of same size

Page (2K) \rightarrow Frame (2K)

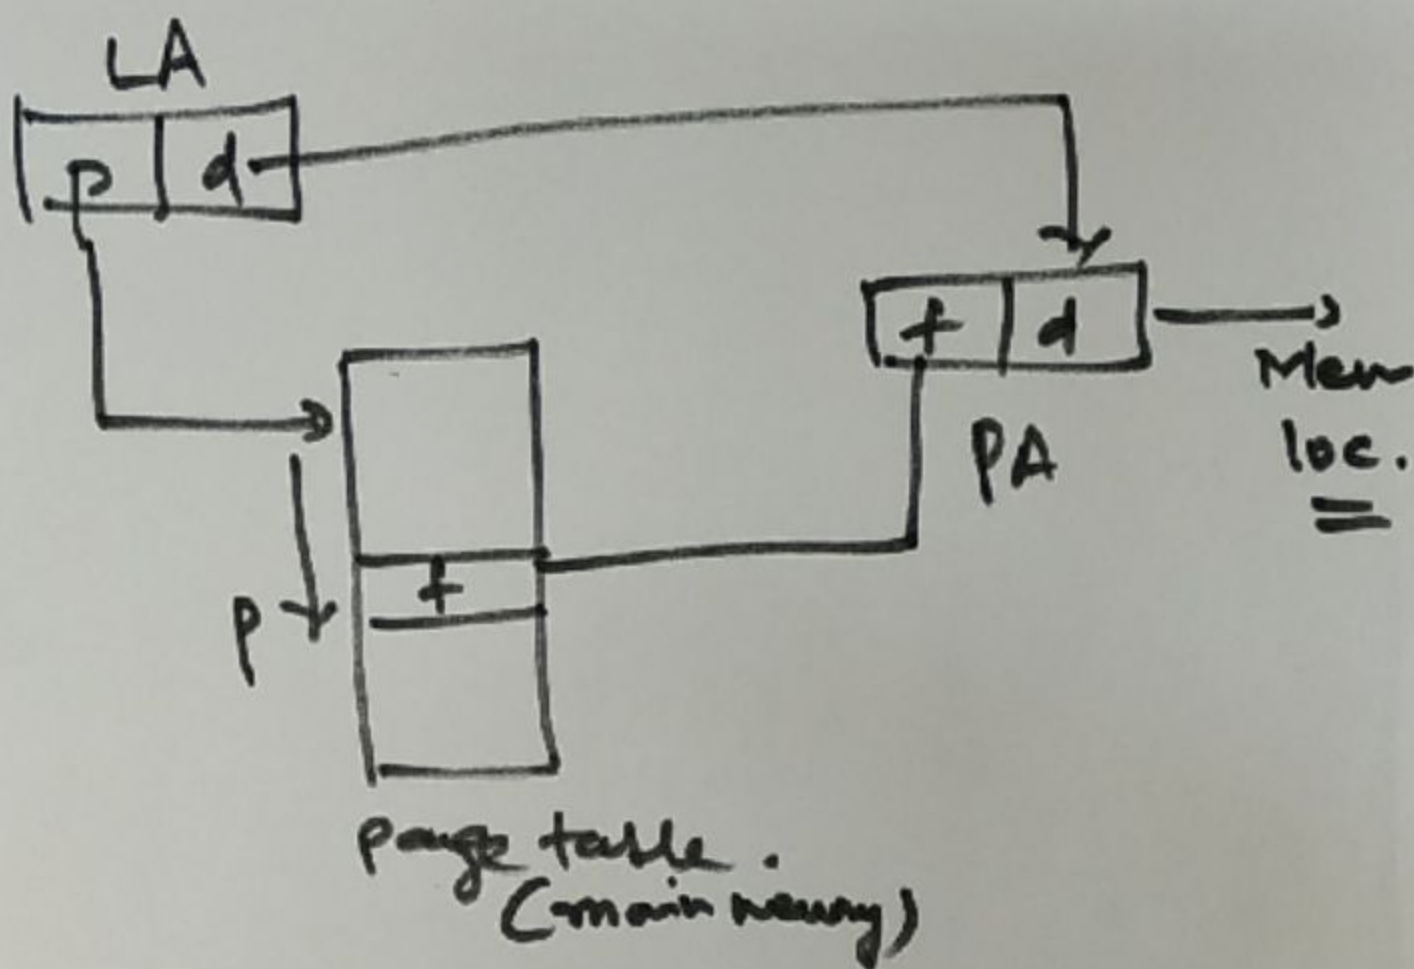

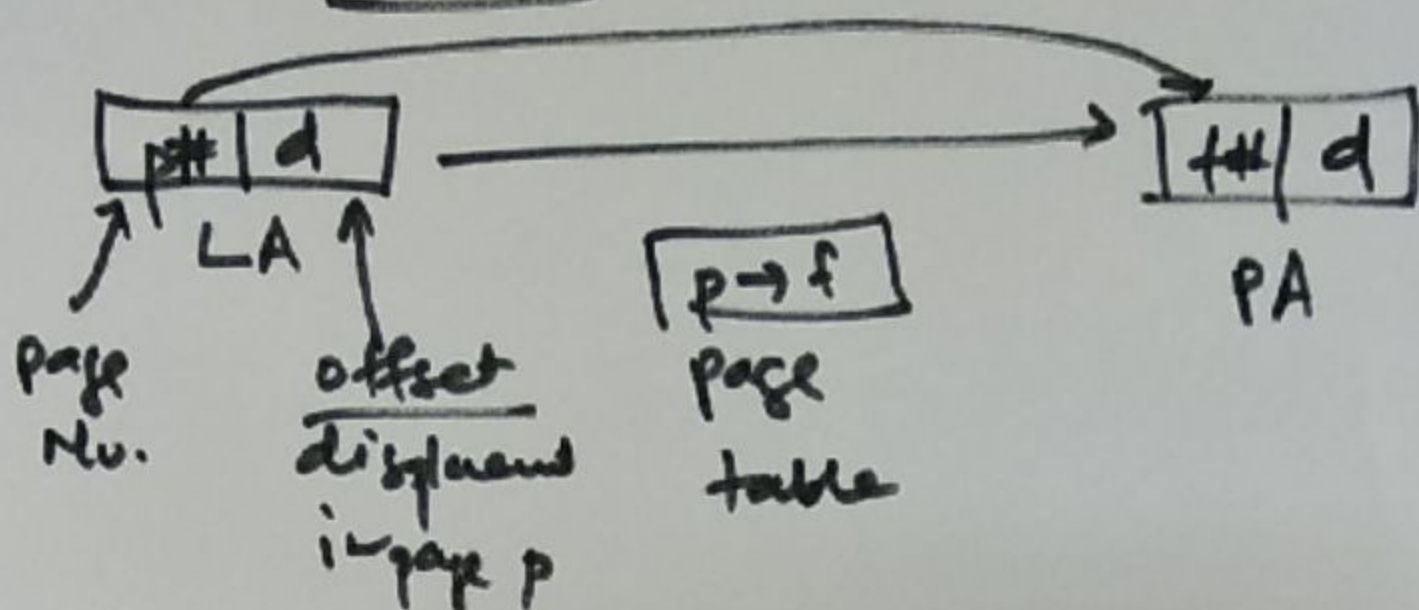

" (4K) \rightarrow " (4K)

⋮

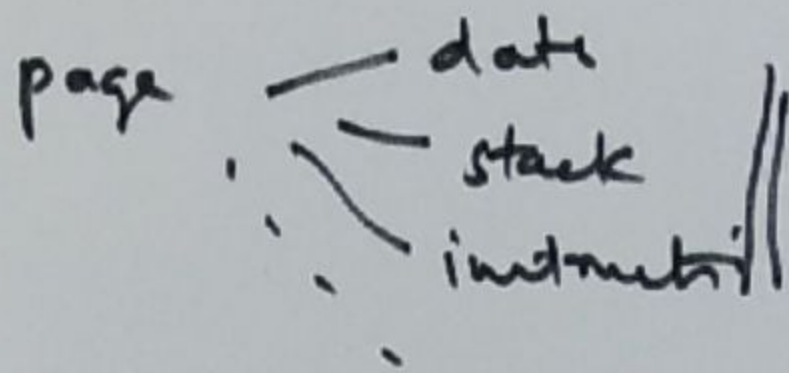

Address Translation

②

EAT
Effective
Access
time

$$= m_a + m_a = 2m_a$$

Segmentation → User / Programmer's View

Code Segment — 16K

Data Segment — 2K

Stack Segment — 1K

— All segments are variable size

— LA → PA

$$EAT = m_d + m_o = 2m_o$$

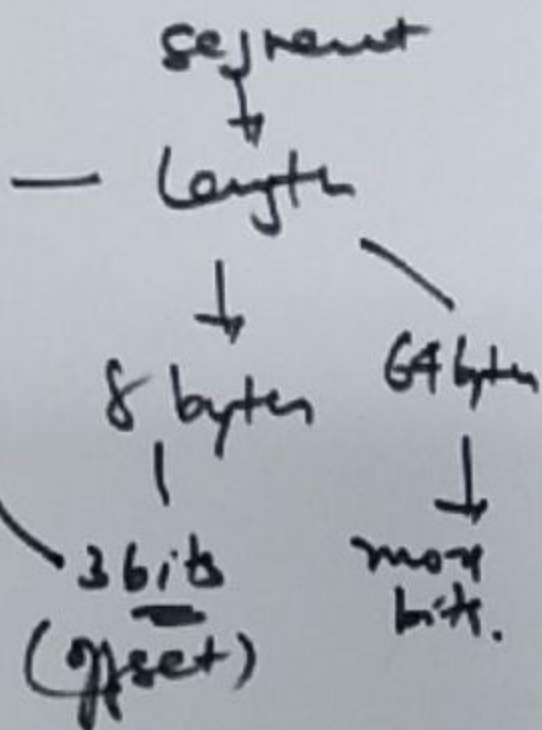

Segment table

s#	size	..

④

- size of segment - important parameter

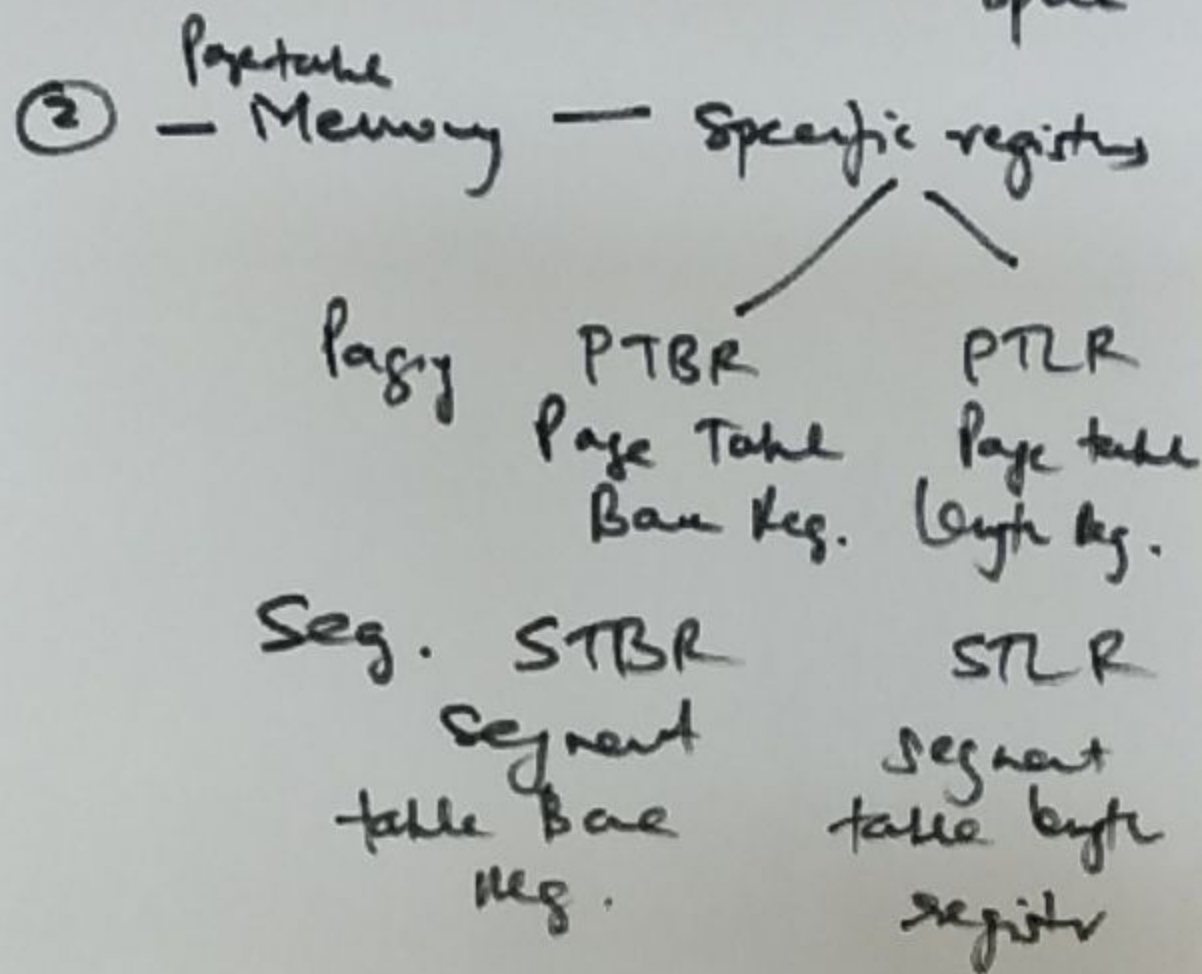

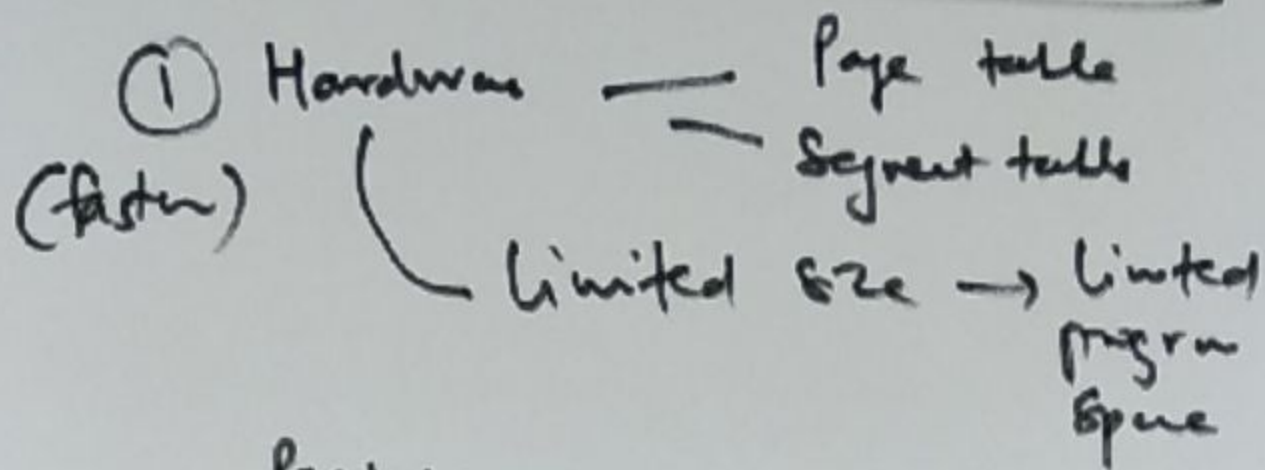

- Good (User)
- Complex

- Real Paging (Simple Paging)
- Real Segmentation (Simple Segmentation)
- Non-Contiguous

→ All pages
All segments } in memory

Page / Segment Table Implementation ⑥

Program A $\xrightarrow{\text{switch}}$ Program B

⑦

~~c~~
PTBR

~~d~~
PTLR

— STBR, STLR

STBR

segment table A

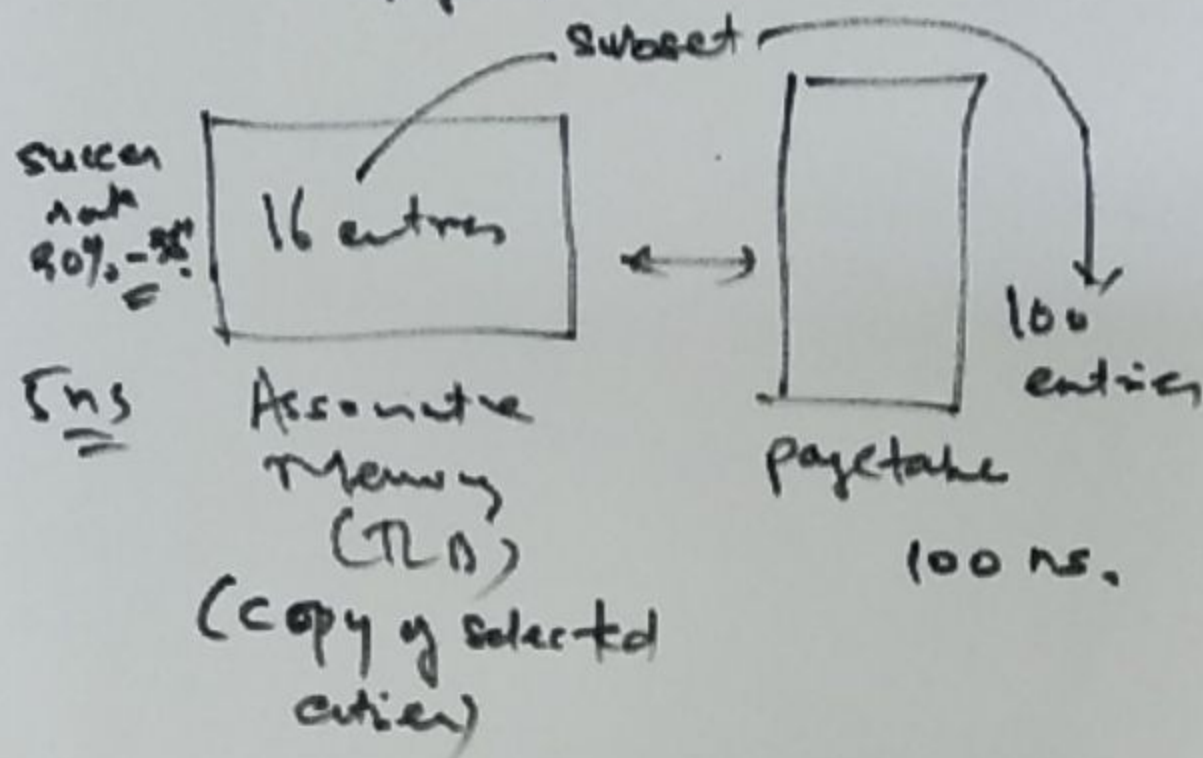

STLR

segment table B

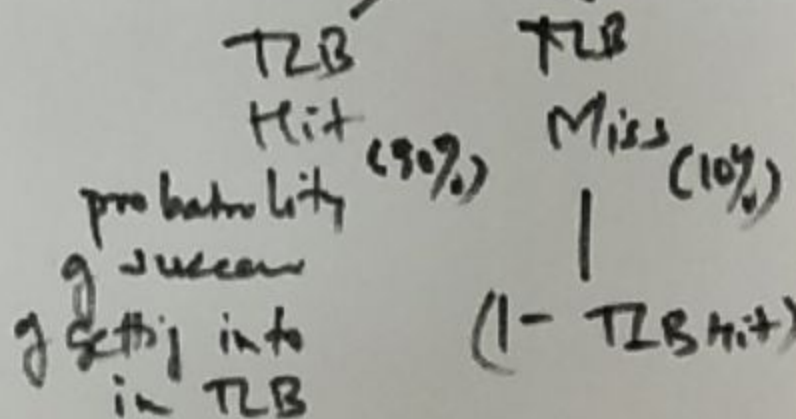

③ Associative Memory (limited) ④

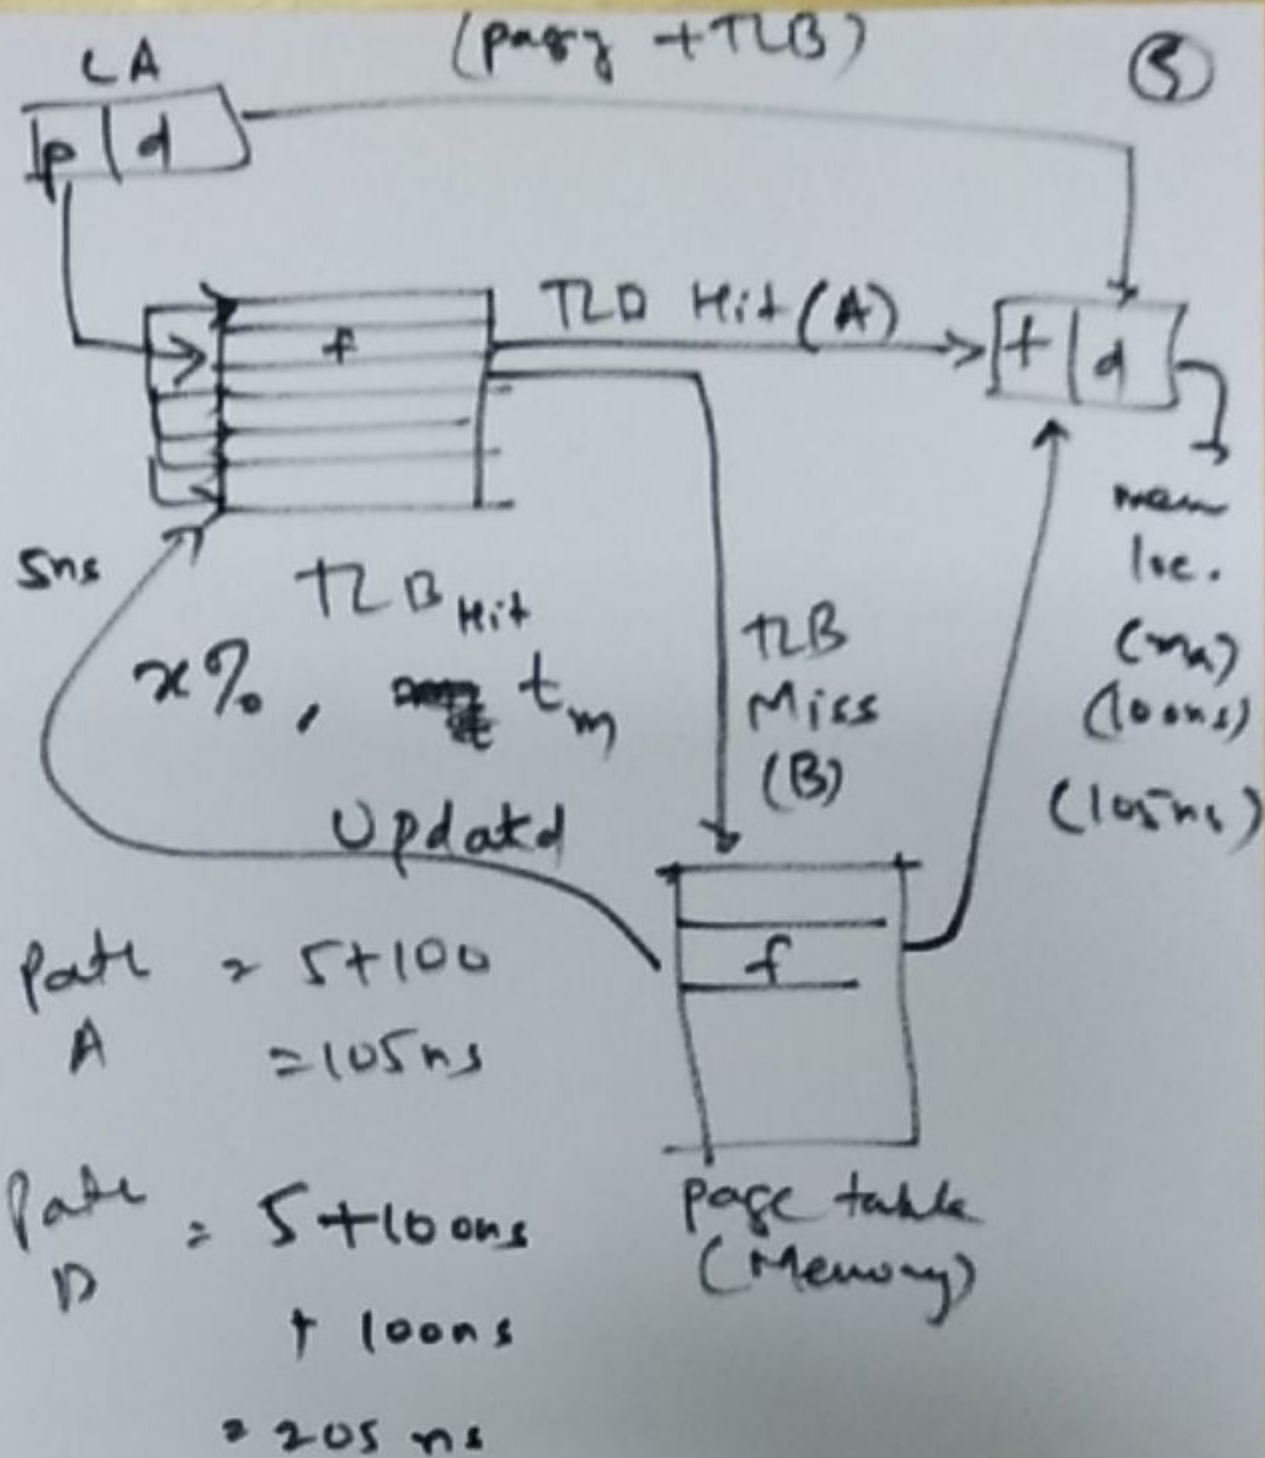

TLB (Translation Lookaside buffer)

Store page table

For LA \rightarrow PA mapping \longrightarrow Looks up TLB

— Running a program is much
 better space — Virtual Memory
